

Protein

- 4 calories/gram
- Made up of amino acids
- 20 different amino acids
- Amino: nitrogen

© 2006 Thomson-Wadsworth

© 2006 Thomson-Wadsworth

Protein

- 9 essential amino acids
 - Histidine
 - Threonine
 - Valine
 - Tryptophan
 - Isoleucine
 - Leucine
 - Lysine
 - Phenylalanine
 - Methionine

Protein

- Proteins are chains of amino acids connected by peptide bonds
 - Dipeptides, tripeptides, polypeptides
- 20 aas make infinite different proteins
- Proteins fold and coil

© 2006 Thomson-Wadsworth

© 2006 Thomson-Wadsworth

Protein

- Denaturing protein = unfolding
 - Heat
 - Agitation
 - Acid
 - Base
 - Alcohol

© 2006 Thomson-Wadsworth

Protein in the body

- Tissues
 - Muscle, skin, connective tissue (tendons, ligaments), organs, bone, hair, nails
 - Keratin
 - Collagen
- Growth and repair
- Energy
- Enzymes
 - Lipase, lactase, etc

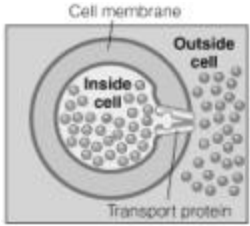

© 2006 Thomson-Wadsworth

Protein in the body

- Hormones
 - Insulin, glucagon
- Blood clotting
- Acid-base balance in blood
- Fluid and electrolyte balance

© 2006 Thomson-Wadsworth

Fluid and electrolyte balance

© Thomson-Wadsworth

Protein in the body

- Antibodies
 - Fight off bacteria and viruses
- Melanin
- Hemoglobin

© 2006 Thomson-Wadsworth

How the body makes proteins

- DNA in nucleus of each cell provides blueprints for thousands of proteins
- Cells put together amino acids in a specific sequence to make proteins (hormones, enzymes, collagen, etc.)

Problems in protein synthesis

- Genetic diseases can cause problems in protein synthesis, for example
- **Sickle cell anemia**
 - One amino acid is different in hemoglobin
 - Alters shape of red blood cell
 - Makes it unable to carry oxygen
 - Symptoms:
 - Abnormal blood clotting
 - Joint pain
 - Greater risk of infection

Protein in food

- DRI:
 - 10 to 35% of calories
 - 0.8 gm/kg (adults)
- Most Americans get more than enough
 - > 1 gm/kg

© 2006 Thomson-Wadsworth

Protein in food

- Sources:
 - Meat
 - Poultry
 - Fish
 - Eggs
 - Milk, cheese
 - Soy
 - Legumes
 - Grains
 - Vegetables

© 2006 Thomson-Wadsworth

Protein in food

- Animal proteins
 - Generally better digested and absorbed
- Plant proteins
 - Generally less well digested and absorbed
- When you get enough protein, as most in the US do, these differences are not significant

© 2006 Thomson-Wadsworth

Protein in food

- Complete protein
 - All essential amino acids
 - Animal proteins and soy
- Incomplete protein
 - Low in one or more essential aa
 - Plant proteins

© 2006 Thomson-Wadsworth

Protein in food

- Limiting amino acids
- Low in grains:
 - Isoleucine
 - Lysine
- Low in legumes:
 - Methionine
 - Tryptophan

© 2006 Thomson-Wadsworth

Amino Acid Composition

	Ile	Lys	Met	Trp
Legumes	Grey	Grey	White	White
Grains	White	White	Grey	Grey
Together	Grey	Grey	Grey	Grey

© 2006 Thomson-Wadsworth

© 2006 Thomson-Wadsworth

Protein in food

- Complementary proteins
 - Traditional food combinations
 - Beans and rice
 - Beans and corn (tortillas)
 - Legumes and wheat (split pea soup with crackers, pasta with beans, peanut butter sandwich)
 - Small amounts of animal protein complements plant proteins (eg. Asian cuisines)

© 2006 Thomson-Wadsworth

Protein digestion

- Stomach acid denatures protein
 - Pepsin enzyme begins to break it down
- Small intestine
 - Pancreatic enzymes (proteases)
 - Enzymes in villi
 - Absorbed as individual amino acids

© 2006 Thomson-Wadsworth

© 2006 Thomson-Wadsworth

Nitrogen balance

- Positive nitrogen balance
 - Body adding protein
 - Athletes, pregnancy, children
- Nitrogen equilibrium
 - Take in enough protein, excrete excess
 - Most adults
- Negative nitrogen balance
 - Losing protein, losing muscle
 - Starvation, anorexia, astronauts, surgery

© 2006 Thomson-Wadsworth

Positive Nitrogen Balance
These people, a growing child, a person building muscle, and a pregnant woman, are all retaining more nitrogen than they are excreting.

Nitrogen Equilibrium
These people, a healthy college student and a young retiree, excrete exactly nitrogen equilibrium.

Negative Nitrogen Balance
These people, an athlete and an elderly person, are losing more nitrogen than they are taking in.

Protein Malnutrition

- PEM – protein energy malnutrition or PCM – protein calorie malnutrition
- Most common in children in developing countries

© 2006 Thomson-Wadsworth

Protein Malnutrition

- Marasmus
 - Chronic inadequate calories and protein
 - ‘Skin and bones,’ little muscle
 - Heart weakened
 - Poor growth

© 2006 Thomson-Wadsworth

Protein Malnutrition

- Marasmus
 - Affects brain development
 - Learning is impaired
 - Poor temperature regulation
 - Lethargy
 - Malabsorption
 - Infection

© 2006 Thomson-Wadsworth

Protein Malnutrition

- Kwashiorkor
 - Acute calorie and protein deprivation
 - Often in older child weaned for new baby
 - Muscle wasting, poor growth, affects brain development

© 2006 Thomson-Wadsworth

Protein Malnutrition

- Kwashiorkor
 - Edema
 - Proteins and hormones that maintain fluid balance are diminished
 - Fluids leak out of the blood and accumulate in the belly and legs
 - Enlarged belly due to fatty liver

© 2006 Thomson-Wadsworth

Protein Malnutrition

- Marasmus and kwashiorkor often overlap
- If caught in time, starvation can be reversed
 - Fluid balances are most critical
 - Electrolyte imbalances may lead to heart failure

© 2006 Thomson-Wadsworth

Will extra protein build muscle?

- Adding more gas to your car won't make it go faster
- Resistance exercise builds muscle
- Some is good, more is not necessarily better

© 2006 Thomson-Wadsworth

Too much protein?

- Strains kidneys, which must dispose of excess nitrogen
- Risk of dehydration
- Animal protein increases calcium loss, weakens bones
- Excess protein stored as fat

© 2006 Thomson-Wadsworth

Vegetarianism

- Well-planned vegetarian diets are associated with:
 - Obesity ↓
 - Heart disease ↓
 - High blood pressure ↓
 - Cancer ↓
 - Life span ↑

© 2006 Thomson-Wadsworth

Vegetarianism

- Vegetarian diets often contain more
 - Fruits, vegetables, whole grains
 - Fiber
 - Potassium
 - Phytochemicals
- And less
 - Total fat
 - Saturated fat

© 2006 Thomson-Wadsworth

Vegetarianism

- Religious reasons
 - Hindu, Seventh Day Adventist, etc
- Ethical reasons
 - Not wanting to kill animals
 - Inhumane treatment of animals
 - Environment
- Health
- Occasionally, eating disorders

© 2006 Thomson-Wadsworth

Vegetarianism

- Lacto-ovo
- Lacto
- Vegan
- Fruitarian
- Raw food
- Macrobiotic

© 2006 Thomson-Wadsworth

Concerns for vegetarians

- Vegan children
 - Too much fiber
- Vitamin B12
 - Fermented soy foods, seaweed, supplement
- Iron
- Zinc
- Calcium
- Vitamin D
- Omega-3 fats

© 2006 Thomson-Wadsworth
